Parts Requiring Angular Tightening
- Use an angle wrench for the final tightening of the following engine parts:
  a) Cylinder head bolts
  b) Main bearing cap bolts (YD series)
  c) Connecting rod cap nuts (KA and YD series)
  d) Crankshaft pulley bolt (YD series)
- Do not use a torque value for final tightening.
- The torque value for these parts are for a preliminary step.
- Ensure thread and seat surfaces are clean and coated with engine oil.

Liquid Gasket Application Procedure
1. Use a scraper to remove all traces of old liquid gasket from mating surfaces and grooves. Also, completely clean any oil from these areas.
2. Apply a continuous bead of liquid gasket to mating surfaces. (Use Genuine Liquid Gasket or equivalent.)
- Be sure liquid gasket diameter is as specified in this manual.
3. Apply liquid gasket around the inner side of bolt holes (unless otherwise specified).
4. Assembly should be done within 5 minutes after coating.
5. Wait at least 30 minutes before refilling engine oil and engine coolant.

1. Warm up engine.
2. Turn ignition switch OFF.
3. Using CONSULT-II, make sure no error codes are indicated for self-diagnosis items. Refer to “Trouble Diagnosis — INDEX” in EC section.
   - Do not disconnect CONSULT-II until the end of this operation; it will be used to check engine rpm and for error detection at the end of this operation.
4. Disconnect the negative battery terminal.
5. To prevent fuel from being injected during inspection, remove fuel injection pump fuse [ENG CONT3 (20A)] from fuse box on the right side of engine compartment.
6. Remove glow plugs from all the cylinders.
   - Before removal, clean the surrounding area to prevent entry of any foreign materials into the engine.
   - Carefully remove glow plugs to prevent any damage or breakage.
   - Handle with care to avoid applying any shock to glow plugs.
7. Install adapter (SST) to installation holes of glow plugs and connect compression gauge for diesel engine.
   - 18 - 21 Н·м (1.8 - 2.2 kg-m, 13 - 15 ft-lb)
8. Connect battery negative terminal.
9. Set the ignition switch to “START” and crank. When gauge pointer stabilizes, read compression pressure and engine rpm. Repeat the above steps for each cylinder.
   - Always use a fully-charged battery to obtain specified engine speed.

- When engine rpm is out of the specified range, check the specific gravity of battery liquid. Measure again under corrected conditions.
- If engine rpm exceeds the limit, check valve clearance and combustion chamber components (valves, valve seats, cylinder head gaskets, piston rings, pistons, cylinder bores, cylinder block upper and lower surfaces) and measure again.
10. Complete this operation as follows:
    a. Turn the ignition switch to “OFF”.
    b. Disconnect battery negative terminal.
    c. Install glow plugs.
    d. Install fuel injection pump fuse [ENG CONT3 (20A)].
    e. Connect battery negative terminal.
    f. Using CONSULT-II make sure no error code is indicated for items of self-diagnosis. Refer to “Trouble Diagnosis — INDEX” in EC section.
1. Charge air cooler cover
2. Charge air cooler
3. Air inlet hose
4. Intake manifold
5. Bracket
6. Air inlet pipe
7. Bracket

**Inspection**

Check air passages of charge air cooler core and fins for clogging, leaks or deformation. Clean or replace charge air cooler if necessary.

- Be careful not to deform core fins.
- For cleaning procedure of charge air cooler core, refer to "CHECKING RADIATOR" in [LC section]

Trouble Diagnosis of Turbocharger

Preliminary check:
- Check that the engine oil level is between MIN and MAX of the dipstick. (When the engine oil amount is more than MAX, the oil flows into the inlet duct through the blow-by gas passage, and the turbocharger is misjudged failure.)
- Ask the customer if he/she always runs the vehicle in idle engine speed to cool the oil down after driving.
- Replace the turbocharger assembly when any malfunction is found after unit inspections specified in the table below.
- If no malfunction is found after the unit inspections, judge that the turbocharger body has no failure. Check the other parts again.

Inspection

CYLINDER HEAD DISTORTION

Clean surface of cylinder head. Use a reliable straightedge and feeler gauge to check the flatness of cylinder head surface. Check along six positions shown in the figure.

Head surface flatness: Limit 0.04 mm (0.0016 in)
If beyond the specified limit, resurface or replace it.

The limit for cylinder head resurfacing is determined by the cylinder block resurfacing.

Resurfacing limit:
- Amount of cylinder head resurfacing is “A”.
- Amount of cylinder block resurfacing is “B”.

The maximum limit: \( A + B = 0.07 \text{ mm (0.0028 in)} \)
After resurfacing cylinder head, check that camshaft rotates freely by hand. If resistance is felt, cylinder head must be replaced.

Nominal cylinder head height:

2. Push out valve approx. 25 mm (0.98 in) toward combustion
   chamber. Swing valve in the direction of the dial gauge to mea-
   sure the runout.
   • This inspection should be performed before removing valve
     guides.
   • Half of the runout reading on the dial gauge is the valve guide
     clearance.
   - Standard:
     Intake: 0.020 - 0.053 mm (0.0008 - 0.0021 in)
     Exhaust: 0.040 - 0.073 mm (0.0016 - 0.0029 in)

   c. If it exceeds the limit, replace valve or valve guide.
VALVE GUIDE REPLACEMENT

- When a valve guide is removed, replace with an oversized [0.2 mm (0.008 in)] valve guide.

1. To remove valve guide, heat cylinder head to 110 to 130°C (230 to 266°F) by soaking in heated oil.

2. Drive out valve guide with a press [under a 20 kN (2 ton, 2.2 US ton, 2.0 Imp ton) pressure] or hammer and suitable tool.

3. Ream cylinder head valve guide hole.
   
   **Valve guide hole diameter (for service parts):**
   10.175 - 10.196 mm (0.4006 - 0.4014 in)

4. Heat cylinder head to 110 to 130°C (230 to 266°F) and press service valve guide onto cylinder head.
   
   **Projection “L”:**
   10.4 - 10.6 mm (0.409 - 0.417 in)

5. Ream valve guide.
   
   **Finished size:**
   6.000 - 6.018 mm (0.2362 - 0.2369 in)
VALVE SEATS

Before starting this check, confirm that the dimensions of valve guides and valves are as specified.

Apply red lead primer on contacting surfaces of valve seat and of valve face to examine the conditions of contacting surfaces.

Check that the paint on contacting surfaces is continuous along the entire circumference.

If there are abnormal indications, grind the valve and check the contact again. If abnormal indications still persist, replace valve seat.

REPLACING VALVE SEAT FOR SERVICE PARTS

1. Bore out old seat until it collapses. Boring should not continue beyond the bottom face of the seat recess in cylinder head. Set the machine depth stop to ensure this.

2. Ream cylinder head recess for service valve seat.
   - Oversize [0.5 mm (0.020 in)]:
     - Intake 30.500 - 30.516 mm (1.2008 - 1.2014 in)
     - Exhaust 29.500 - 29.516 mm (1.1614 - 1.1620 in)
   - Be sure to ream in circles concentric to the valve guide center.

This will enable valve seat to fit correctly.

3. Heat cylinder head to 110 to 120°C (230 to 248°F) by soaking in heated oil.

4. Sufficiently cool valve seat with dry ice. Force fit valve seat into cylinder head.

WARNING:
Do not touch cold valve seat with your bare hands.

5. Cut or grind valve seat using suitable tool to the specified dimensions as shown in SDS (EM-170).

CAUTION:
Use the valve seat cutter properly. Securely gripping the cutter handle with both hands, press the cutter down onto the entire circumference of the contacting surface and finish cutting at one time. Improper pressing of the cutter or cutting in several steps may result in staged surface on the valve seat.

6. After cutting, lap valve seat with abrasive compound.

7. Check valve seating condition. Refer to EM-57, “Valve Seats.”
8. Use a depth gauge to measure the distance between the mounting surface of the cylinder head spring seat and the valve stem end. If the distance is shorter than specified, repeat step 5 above to adjust it. If it is longer, replace the valve seat with a new one.

Valve seat resurface limit “L”:
- Intake 36.53 - 36.98 mm (1.4382 - 1.4559 in)
- Exhaust 36.53 - 37.01 mm (1.4382 - 1.4571 in)

**VALVE DIMENSIONS**

Check dimensions of each valve. For dimensions, refer to SDS (EM-167).

When valve head has been worn down to 0.5 mm (0.020 in) in margin thickness, replace valve.

Grinding allowance for valve stem tip is 0.2 mm (0.008 in) or less.

**VALVE SPRING**

Squareness
1. Measure dimension “S”.
   
   Out-of-square “S”:
   - Limit 1.9 mm (0.075 in)
2. If it exceeds the limit, replace spring.
Pressure

Check valve spring pressure at specified spring height.

**Standard:**
- Free height 43.7 mm (1.720 in)
- Installation height 32.82 mm (1.2921 in)
- Installation load 184 - 208 N (18.77 - 21.22 kg, 41.4 - 46.8 lb)

- Load with valve open 320 - 360 N (32.65 - 36.73 kg, 71.9 - 80.9 lb)

If it exceeds the standard, replace spring.

**VALVE LIFTER**

1. Check contact and sliding surfaces for wear or scratches.

2. Check diameter of valve lifter and valve lifter guide bore.
   - **Valve lifter outer diameter:**
     - 29.960 - 29.975 mm (1.1795 - 1.1801 in)
   - **Lifter guide bore diameter:**
     - 30.000 - 30.021 mm (1.1811 - 1.1819 in)
   - **Clearance between lifter and lifter guide:**
     - **Standard 0.025 - 0.061 mm (0.0010 - 0.0024 in)**
     - If the value is out of the range, replace valve lifter and/or cylinder head, referring to the specified values for the outer diameter and bore diameter.

**Assembly**

1. Install valve oil seal.
   - Using valve oil seal drift (SST), install so that the dimension shown in the figure is obtained. The dimension in the figure shows the dimension before the valve spring seat is installed.
   - Different parts should be used depending on the valve oil seal location. Identify by the rubber color.
     - **For intake:** Black
     - **For exhaust:** Brown
   - Always use new valve oil seal.
   - Before installing valve oil seal, install valve spring seat.
2. Install other valve component parts. Refer to “Disassembly”, EM-52.
   - After installing valve collets, tap valve stem tip with plastic hammer to assure a proper fit.

### Installation

- Before installation, remove old liquid gasket from mating surface of all liquid gasket applied parts.

### CYLINDER HEAD GASKET SELECTION

- Select and install cylinder head gasket with appropriate thickness according to the following procedure:

**When replacing gasket alone:**

- Install a gasket with the same thickness as that of the one removed.
- Identify the thickness of gasket by the number of cut-outs and holes on the rear RH side.

Gasket thickness can be identified at the location shown in the figure by the numbers of cut-outs before removal.

When the following parts have been repaired/replaced:
- With cylinder block upper surface and/or crankshaft pin journal ground
- With cylinder block, pistons, connecting rods, and/or crankshaft replaced

1. Set piston at a point close to TDC.
2. Set a dial gauge at the location as shown in the figure. Turning crankshaft gradually, set the gauge scale to “0” where the piston protrusion is maximized.
3. Move the dial gauge stand so that the tip of dial gauge can contact the cylinder block. Read the difference.
4. Measure at two locations per cylinder, that is eight locations for four cylinders. Select gasket based on the maximum protrusion of eight measurements.

  Standard: 23.53 - 24.07 mm (0.9264 - 0.9476 in)
- If the difference is out of the range, check fitting of dowel pins and cylinder head.
LIQUID GASKET APPLICATION ON REAR CHAIN CASE

Apply a continuous bead of specified liquid gasket (Refer to EM-3, “Liquid Gasket Application Procedure”) on the surface shown in the figure.

A: Apply bead so that it does not protrude into oil passage.
B: Minimize the overlapping area of the bead, with start and end areas of bead as shown in the figure.

Apply so that the portion marked * comes at an external location but cannot be viewed externally after engine is assembled.

CYLINDER HEAD INSTALLATION

Valve Clearance

CHECKING

Check valve clearance while engine is cold and not running.
1. Set the No. 1 piston to TDC on its compression stroke.
   - Turn crankshaft pulley clockwise so that the knock pin on camshaft LH faces straight above. (No position indicator, etc. is provided on the crankshaft pulley.)
2. Put an alignment mark with paint, etc. on the crankshaft pulley and on the oil pump as an angle indicator.

3. Check only those valves shown in the figure.

</tr>
</tbody>
</table>

- Using a feeler gauge, measure clearance between valve lifter and camshaft.

ADJUSTING

Adjust valve clearance while engine is cold.
1. Turn crankshaft, to position cam lobe on camshaft of valve that must be adjusted upward.
2. Place Tool (A) around camshaft as shown in figure. Before placing Tool (A) (SST), rotate notch toward center of cylinder head (See figure.), to simplify shim removal later.

CAUTION:
Be careful not to damage cam surface with Tool (A).
3. Rotate Tool (A) (See figure.) so that valve lifter is pushed down.

4. Place Tool (B) (SST) between camshaft and the edge of the valve lifter to retain valve lifter.

**CAUTION:**
- Tool (B) must be placed as close to camshaft bracket as possible.
- Be careful not to damage cam surface with Tool (B).

5. Remove Tool (A).

6. Blow air into the hole to separate adjusting shim from valve lifter.
   - To avoid engine oil spills, wipe off oil fully beforehand. Wear safety goggles, etc. during work if necessary.

7. Remove adjusting shim using a small screwdriver and a magnetic finger.

8. Determine replacement adjusting shim size following formula.
   - Using a micrometer determine thickness of removed shim.
   - Calculate thickness of new adjusting shim so valve clearance comes within specified values.
   - Intake:
     \[ N = R + [M - 0.28 \text{ mm (0.0110 in)}] \]
   - Exhaust:
     \[ N = R + [M - 0.30 \text{ mm (0.0118 in)}] \]

Shims are available in 33 sizes from 2.10 mm (0.0827 in) to 2.74 mm (0.1079 in), in steps of 0.02 mm (0.0008 in).

Removal and Installation

**CAUTION:**
- When installing bearings, pistons, or other sliding parts, lubricate contacting surfaces with new engine oil.
- Place removed parts such as bearings and bearing caps in their proper order and direction.
- When installing connecting rod nuts, and main bearing cap bolts, apply new engine oil to threads and seating surfaces.
- Do not allow any magnetic materials to contact the signal plate of flywheel.
- Do not remove the signal plate at back.
- Do not place the signal plate side facing under.
- Handle with care so as not to damage the signal plate [especially four places on protrusions for signal of crank position sensor (TDC sensor)].

Disassembly

**PISTON AND CRANKSHAFT**

2. Place engine on a work stand.
   a. Remove flywheel.
      - Hold ring gear with ring gear stopper (KV10105630, KV10105610). Then, loosen securing bolts with TORX socket (size: Q8 E20, Commercial Service Tool) and remove them. As an alternative method, hold the crankshaft pulley with a pulley holder (SST) to remove the flywheel.
   b. Install engine sub-attachment (SST) to rear surface of cylinder block.

      BDC.
   b. Remove connecting rod cap.
   c. Push piston and connecting rod assembly toward cylinder head
      using a hammer handle.
   - Before removing piston and connecting rod assembly, check
     connecting rod side clearance. Refer to **EM-74**, "CONNECT-
     ING ROD SIDE CLEARANCE".

**EM-72**
CAUTION:
When removing the piston and connecting rod assembly, prevent the big end of the connecting rod from interfering with the oil jet.

10. Remove connecting rod bearings from connecting rod and connecting rod cap.
   - Store the removed parts in sets by the cylinder No. to avoid mixing them up.

11. Remove piston rings from pistons.
   - Use piston ring expander (Commercial Service Tool).
   - Avoid scratching pistons during removal.
   - Be careful not to damage piston rings by expanding excessively.

CAUTION:
- When piston rings are not replaced, make sure that piston rings are mounted in their original positions.

12. Remove piston from connecting rod.
   a. Remove snap rings using snap ring pliers.
   b. With an industrial drier, heat pistons to 60 to 70°C (140 to 158°F).
   c. Push out piston pin with a rod approx. 26 mm (1.02 in) in diameter.
13. Remove main bearing cap bolts.
   - With a TORX socket (size: E-14, Commercial Service Tool), loosen main bearing cap bolts in several stages in the reverse order of that shown in the figure and remove them.
   - Before loosening main bearing cap bolts, measure crankshaft end play. Refer to EM-74, “CRANKSHAFT END PLAY”.

14. Remove main bearing caps.
   - Using main bearing cap bolts, remove by rocking bearing cap back and forth.

15. Remove crankshaft.

16. Remove main bearings and thrust bearings from cylinder block and main bearing caps.
   - Check the correct installation locations of removed parts. Store them so they do not get mixed up.

17. Remove oil jet.

18. Remove oil jet check valve.

**Inspection**

**CRANKSHAFT END PLAY**
   - Measure the moving distance of the crankshaft with the dial gauge when the crankshaft is moved fully forward or backward.
     - **Standard:** 0.085 - 0.25 mm (0.0033 - 0.0098 in)
     - **Limit:** 0.30 mm (0.0118 in)
   - If the value exceeds the limit, replace thrust bearings with new ones and measure again. If the measurement exceeds the limit again, replace crankshaft with a new one.

**CONNECTING ROD SIDE CLEARANCE**
   - Measure the side clearance between connecting rod and crank arm with feeler gauge.
     - **Standard:** 0.200 - 0.350 mm (0.0079 - 0.0138 in)
     - **Limit:** 0.4 mm (0.016 in)
   - If the value exceeds the limit, replace connecting rod and measure again. If the measurement exceeds the limit again, replace the crankshaft.
PISTON AND PISTON PIN CLEARANCE

1. Measure inner diameter of piston pin hole “dp”.
   **Standard diameter “dp”**: 27.997 - 28.005 mm (1.1022 - 1.1026 in)

2. Measure outer diameter of piston pin “Dp”.
   **Standard diameter “Dp”**: 27.994 - 28.000 mm (1.1021 - 1.1024 in)

3. Calculate interference fit of piston pin to piston.
   \[ Dp - dp = 0.002 - 0.006 \text{ mm (0.0001 - 0.0002 in)} \]
   If it exceeds the above value, replace piston assembly with pin.

PISTON RING SIDE CLEARANCE

- **Top ring**: 0.050 - 0.090 mm (0.0020 - 0.0035 in)
- **2nd ring**: 0.050 - 0.090 mm (0.0020 - 0.0035 in)
- **Oil ring**: 0.030 - 0.070 mm (0.0012 - 0.0028 in)

Max. limit of side clearance:
- Top ring 0.1 mm (0.004 in)
- 2nd ring 0.1 mm (0.004 in)

- To measure top ring side clearance, align the outer circumferences of the ring and piston while pressing ring upward against the upper surface of the ring groove. Under this condition, measure the clearance between ring and bottom surface of the ring groove.
- If out of specification, replace piston ring. If clearance exceeds maximum limit with new ring, replace piston.

PISTON RING END GAP

- **End gap**:
  - Top ring 0.21 - 0.31 mm (0.0083 - 0.0122 in)
  - 2nd ring 0.37 - 0.52 mm (0.0146 - 0.0205 in)
  - Oil ring 0.30 - 0.55 mm (0.0118 - 0.0217 in)

Max. limit of ring gap:
- Top ring 1.0 mm (0.039 in)
- 2nd ring 1.0 mm (0.039 in)
- Oil ring 1.0 mm (0.039 in)

If out of specification, replace piston ring. If gap still exceeds the limit even with a new ring, do the following. Re bore cylinder and use oversized piston and piston rings.
When replacing the piston, check the cylinder block surface for scratches or seizure. If scratches or seizure is found, hone or replace the cylinder block.

CONNECTING ROD BEND AND TORSION

- **Bend:**
  - Limit 0.12 mm (0.0047 in) per 100 mm (3.94 in) length

- **Torsion:**
  - Limit 0.12 mm (0.0047 in) per 100 mm (3.94 in) length

If it exceeds the limit, replace connecting rod assembly.

CYLINDER BLOCK DISTORTION AND WEAR

- Clean upper surface of cylinder block. Use a reliable straight-edge and feeler gauge to check the flatness of cylinder block surface. Check along six positions shown in the figure.
  - **Distortion limit:** 0.04 mm (0.0016 in)

- If out of specification, resurface it. The limit for cylinder block resurfacing is determined by cylinder head resurfacing in engine.
  - **Resurfacing limit:**
    - Amount of cylinder head resurfacing is “A”.
    - Amount of cylinder block resurfacing is “B”.
    - The maximum limit is as follows:
      - \[ A + B = 0.07\text{ mm (0.0028 in)} \]
    - Nominal cylinder block height from crankshaft center: 252.95 - 253.05 mm (9.9586 - 9.9626 in)

- If necessary, replace cylinder block.
Inspection (Cont’d)

PISTON-TO-BORE CLEARANCE

1. Using a bore gauge, measure cylinder bore in X and Y directions at A, B and C for wear, out-of-round and taper.

   **Cylinder bore inner diameter:**
   - **Standard:** 89.000 - 89.030 mm (3.5039 - 3.5051 in)
   - **Wear limit:** 0.07 mm (0.0028 in)
   - If it exceeds the limit, rebore all cylinders. Replace cylinder block if necessary.

   **Out-of-round (X − Y):**
   - Limit 0.015 mm (0.0006 in)

   **Taper (C − A):**
   - Limit 0.010 mm (0.0004 in)

2. Check for scratches and seizure. If seizure is found, hone it.

3. Measure piston skirt diameter.

   **Piston diameter “A”:**
   - **Standard:** 88.940 - 88.970 mm (3.5016 - 3.5027 in)
   - **Measuring point “a” (Distance from the top):** 59.0 mm (2.323 in)

4. Check that piston-to-bore clearance is within specification.
   - Calculate the clearance by using outer diameter at piston skirt and inner diameter of cylinder (direction of X, point B):
   
   **Piston-to-bore clearance = Cylinder bore − Piston diameter “A”**

   - **Standard [at room temperature 20°C (68°F)]:**
     - 0.050 - 0.070 mm (0.0020 - 0.0028 in)
   
   - If the value is out of the specified range, replace piston and piston pin assembly.

- If cylinder block or pistons are replaced with new ones, select piston as follows:

**When using a new cylinder block:**

- Identify the cylinder bore grade (No. 1, 2, or 3) on LH surface at the rear of cylinder block and select a piston of the same grade.
- The part No. of piston is specified together with the piston pin as an assembly.
When re-using a removed cylinder block:
- Measure the inner diameter of the cylinder block bore.
- Determine the bore grade by comparing the measurement with the values under “Cylinder bore ID” of the table below. Choose a piston of the same grade.

Selective fitting for piston:

5. Determine piston oversize according to amount of cylinder wear.
- For oversize pistons, 0.25 and 0.5 OS [0.25 mm (0.0098 in), 0.5 mm (0.0197 in) oversize] are available as service parts. Refer to SDS, EM-172. When using an oversize piston, hone cylinder so that the clearance between piston and cylinder becomes the specified value. Be sure to use appropriate oversize piston ring for the oversize piston.

6. Cylinder bore size is determined by adding piston-to-bore clearance to piston diameter “A”.

Rebored size calculation: \( D = A + B - C \)

where,
- \( D \): Bored diameter
- \( A \): Piston diameter as measured
- \( B \): Piston-to-bore clearance
- \( C \): Honing allowance 0.02 mm (0.0008 in)

7. Cut cylinder bores.
- When any cylinder needs boring, all other cylinders must also be bored.
- Do not cut too much out of cylinder bore at a time. Cut only 0.05 mm (0.0020 in) or so in diameter at a time.

8. Hone cylinders to obtain specified piston-to-bore clearance.

- Measurement should be done after cylinder bore cools down.
CRANKSHAFT

1. Check crankshaft main and pin journals for score, wear or cracks.
2. With a micrometer, measure journals for taper and out-of-round.
   - **Out-of-round** \((X - Y)\):
     - **Standard**: 0.003 mm (0.0001 in)
     - **Limit**: 0.005 mm (0.0002 in)
   - **Taper** \((A - B)\):
     - **Standard**: 0.003 mm (0.0001 in)
     - **Limit**: 0.005 mm (0.0002 in)
3. Measure crankshaft runout at No. 3 (center) journal.
   - **Runout (Total indicator reading):**
     - **Standard**: 0.05 mm (0.0020 in)
     - **Limit**: 0.10 mm (0.0039 in)

MAIN BEARING HOUSING INNER DIAMETER

- Without installing main bearings, install main bearing caps, and tighten bolts to the specified torque.
- Measure the inner diameter of main bearing housing with a bore gauge.
  - **Standard:**
    - 66.654 - 66.681 mm (2.6242 - 2.6252 in) dia.
- If the measurement is out of the specified range, replace cylinder block and main bearing caps.

BEARING CLEARANCE

- Use either of the following two methods, however, method “A” gives more reliable results and is preferable.
- **Method A (Using bore gauge & micrometer)**
  - **Main bearing**
    1. Install main bearings to the cylinder block and bearing cap, and tighten the bolts to the specified torque. Then, measure the inner diameter of the main bearings.
    - **Oil clearance** = **Bearing ID** – **Crankshaft journal OD**
    - **Standard:** 0.039 - 0.066 mm (0.0015 - 0.0026 in)
2. If the value is out of the specified range, select main bearings to obtain the specified oil clearance, based on the measurements of the main bearing housing inner diameter and crankshaft journal outer diameter.

When using a new cylinder block and crankshaft:
1) Identify the bearing housing grade (No. 0, 1, or 2) on LH surface at the rear of the cylinder block, and locate the applicable grade on the “Grade” row in the table below.
2) Identify the journal grade (No. 0, 1, or 2) on the front surface of the crankshaft, and locate the applicable grade under the “Grade” column on the table.
3) The main bearing to be used (STD 0 to STD 4) can be located in the cell where the row and column cross.

When re-using removed cylinder block and crankshaft:
1) Measure the inner diameter of cylinder block main bearing housing.
2) Locate the applicable cell where the measurement falls, on “Cylinder block main bearing housing ID” row on the table.
3) Measure the outer diameter of the crankshaft journal.
4) Locate the applicable cell where the measurement falls, under “Crankshaft journal OD” column on the table.
5) The main bearing to be used (STD 0 to STD 4) can be located in the cell where the row and column cross.

### Connecting Rod Bearing (Big end)

1. Install connecting rod bearing to connecting rod and cap.
2. Install connecting rod cap to connecting rod.
   - **Tighten bolts to the specified torque.**
3. Measure inner diameter “C” of connecting rod.
   - **Inner diameter:**
     - Standard 55.000 - 55.013 mm (2.1654 - 2.1659 in)
4. Measure outer diameter “Dp” of each crankshaft pin journal.
5. Calculate connecting rod bearing clearance.
   \[
   \text{Connecting rod bearing clearance} = C - D_p
   \]
   Standard: 0.031 - 0.061 mm (0.0012 - 0.0024 in)
6. If it exceeds the standard, replace bearing.

When using a new crankshaft and connecting rods:
- Identify the pin diameter grade (No. 0, 1, or 2) on front surface of crankshaft and select the connecting rod bearings of the same grade.
- There is no grading for the inner diameter of the big end of the connecting rod.

When re-using the removed crankshaft and connecting rods:
- Measure the inner diameter of the big end of the connecting rod and make sure it is within the specified range.
- Measure the outer diameter of the crankshaft pin.
- Determine the crankshaft pin grade by comparing the measurement with the values under the column “Crankshaft pin OD” of the table below. Choose the bearings of the same grade.

**CAUTION:**
When grinding the crankshaft journal to use an undersize bearing, avoid damaging the fillet R.

Standard dimension R:
1.5 - 1.7 mm (0.0591 - 0.0669 in)

**Method B (Using plastigage)**

**CAUTION:**
- Do not turn crankshaft or connecting rod while plastigage is being inserted.
- When bearing clearance exceeds the specified limit, ensure that the proper bearing has been installed. If incorrect bearing clearance exists, use a thicker or undersized main bearing to ensure specified clearance.

**MAIN BEARING CRUSH HEIGHT**
- When the bearing cap is removed after being tightened to the specified torque with main bearings installed, the tip end of bearing must protrude.
  - **Standard:** There must be crush height.
- If the standard is not met, replace main bearings.

**MAIN BEARING CAP BOLT DEFORMATION**
- Measure the outer diameter of threaded area, d1 and d2, at the points specified in the figure.
- When the necked point is identified at a point other than where specified, measure at the point as d2.
- Calculate the difference between d1 and d2.
  - **Limit:** 0.13 mm (0.0051 in)
CONNECTING ROD BUSHING CLEARANCE (SMALL END)

1. Measure inner diameter “C” of bushing.
   - Inner diameter “C”:

- If the nut does not screw in smoothly, measure the outer diameter of the bolt thread at the point specified in the figure.
- If a necked point is identified, measure at that point.
  - Standard: 8.90 - 9.00 mm (0.3504 - 0.3543 in) dia.
  - Limit: 8.75 mm (0.3445 in) dia.
- If the measurement exceeds the limit, replace connecting rod bolts and nuts.

FLYWHEEL RUNOUT

- Runout (Total indicator reading):
  - Less than 0.15 mm (0.0059 in)

CAUTION:

- The signal plate is built into the flywheel assembly. Be careful not to damage the signal plate, especially the teeth.
- Check the signal plate for deformation or cracks.
- Never place the flywheel assembly with the signal plate facing down.
- Keep any magnetized objects away from the signal plate.
- Do not allow any magnetic materials to contact the signal plate teeth.

OIL JET

- Check nozzle for deformation or damage.
- Check oil passage for obstruction by blowing in air on nozzle side.
- If abnormality is found, clean or replace.
OIL JET RELIEF VALVE
Using a clean resin rod, press down on the check valve inside relief valve. Check for appropriate bounce/repulsion and smooth operation.

Assembly
PISTON
1. With using snap ring pliers, install snap rings to grooves at the rear side of the piston.
   - Install securely to fully fit into the groove.
2. Install piston to the connecting rod.
   - Heat the piston with an industrial drier to 60 to 70°C (140 to 158°F) so that the piston pin can be easily inserted by finger. Then, insert the piston pin from the front of the piston into the piston and into the connecting rod.
   - Assemble so that the front mark on the piston top surface and cylinder No. stamped on connecting rod are positioned as shown in the figure.
3. Install snap ring on piston front.
   - Refer to step 1. above for notes for installation.
   - After installing, check that the connecting rod moves smoothly.
4. Install piston rings using piston ring expander (Commercial Service Tool).
   - Be extremely careful to avoid any damage to the piston.
   - Install top ring and second ring with the punched surface facing upward.
     Identification mark:
     - Top ring R
     - Second ring 2R
   - Install rings so that three closed gap position 120° apart one another.
   - Closed gaps do not need to face in a specific directions, as long as each are positioned 120° apart.

CRANKSHAFT
1. Blow air sufficiently into the coolant passage, oil passage in the cylinder block, inside of crankshaft case, and inside of cylinder bores to remove any foreign materials.
2. Install oil jet relief valves.
3. Install oil jets.
4. Install main bearings and thrust bearings.
   a. Remove debris, dust, and oil from the locations on the cylinder block and main bearing caps where bearings are installed.
   b. Install thrust bearing on each side of cylinder block No. 3 housing.
      ● Install thrust bearings with oil groove facing in the direction of the crankshaft arm (outside).
   c. Be sure to install main bearings in the correct direction.
      ● Make sure those with oil holes or oil grooves are mounted on the cylinder block side, and those without oil holes or oil grooves are on the main cap side.
      ● Before installing, apply engine oil on the front (inner) surfaces of bearings. Do not apply oil to the back surfaces, but thoroughly clean them.
      ● Align stopper notches on bearings and install.
      ● Check the oil holes on cylinder block and those on bearings are aligned.

5. Install crankshaft to cylinder block.
   ● Make sure crankshaft rotates smoothly by hand.

6. Install main bearing caps.
   ● Identify main bearing caps by the punched mark. Install correctly, matching the journal No. on the bearing cap and the journal, with the front mark facing forward.
   ● Main bearing caps are commonly processed with the cylinder block. Therefore, caps and cylinder block should be replaced as a set.
7. Check the main bearing cap bolts for deformation. Refer to EM-83, “MAIN BEARING CAP BOLT DEFORMATION”.
8. Tighten the main bearing cap bolts according to the following procedure:
   a. Apply engine oil to the threaded part and seat surface of each bolt.
   b. Tighten to 25 to 30 N·m (2.5 to 3.1 kg·m, 18 to 22 ft·lb) in the numerical order shown in the figure.
   c. Put alignment marks (with paint) on each bolt and the main bearing cap, all in the same direction. (when using a protractor)
   d. Then, tighten 90° to 95° [target: 90°].
      - Always use either an angle wrench (SST) or protractor during angular tightening. Avoid tightening based on visual checks alone.
      - After tightening bolts to specified torque, make sure that crankshaft rotates smoothly.
      - Check crankshaft end play. Refer to EM-74, “CRANKSHAFT END PLAY”.
9. Check the outer diameter of connecting rod bolts. Refer to EM-84, “CONNECTING ROD BOLT DEFORMATION”.
10. Install piston to connecting rod.
11. Install connecting rod bearing to connecting rod and connecting rod cap.
      - Before installing, apply engine oil on the front (inner) surface of bearing. Do not apply oil to the back surface, but thoroughly clean it.
      - Align stopper notches on connecting rod and protrusions on bearing and install.
12. Install piston and connecting rod assembly to crankshaft.
      - Set crankshaft pin of the installation location at BDC.
      - Match the cylinder No. of connecting rod to the location of cylinder.
      - Using piston ring compressor (Commercial Service Tool), install so that the front mark on the piston top surface faces in the direction of engine front.
13. Install connecting rod caps.
      - Match the cylinder No. punched on connecting rod and that on cap.
      - Make sure that the front mark on connecting rod cap faces towards the front of the engine.
14. Tighten connecting rod nuts according to the following procedure:
   a. Apply engine oil on bolt threads and seat surface of nuts.
   b. Tighten to 29 to 30 N-m (2.9 to 3.1 kg-m, 21 to 22 ft-lb).
   c. Loosen completely to 0 N-m (0 kg-m, 0 in-lb).
   d. Tighten to 19 to 20 N-m (1.9 to 2.1 kg-m, 14 to 15 ft-lb).
   e. Tighten 120° to 125° [target: 120°]. (angular tightening)
   - Always use either an angle wrench (SST) or protractor during angular tightening. Avoid tightening based on visual checks alone.
   - After tightening nuts, check that crankshaft rotates smoothly.
   - Check connecting rod side clearance. Refer to EM-74, “CONNECTING ROD SIDE CLEARANCE”.
15. Force fit rear oil seal into rear oil seal retainer.
   - Using a drift [105 mm (4.13 in) dia.], force fit so that the dimension is as specified in the figure.
   - Avoid inclined fitting. Force fit perpendicularly.
16. Install rear oil seal retainer.
   - Apply a continuous bead of specified liquid gasket (Refer to EM-3, “Liquid Gasket Application Procedure”) on locations shown in the figure.

1. Warm up engine.
2. Turn ignition switch OFF.
3. Using CONSULT-II, make sure no error codes are indicated for self-diagnosis items. Refer to EC section, “TROUBLE DIAGNOSIS — GENERAL DESCRIPTION”.
   - Do not disconnect CONSULT-II until the end of this operation; it will be used to check engine rpm and for error detection at the end of this operation.
4. Disconnect the negative battery terminal.
5. Remove the following parts.
   - Throttle body
   - Rocker cover
6. To prevent fuel from being injected during inspection, remove fuel injection pump fuse [ENG CONT3 (20A)] from fuse box on the right side of engine compartment.

---

### Inspection

**TURBOCHARGER**

**CAUTION:**
When the compressor wheel, turbine wheel, or rotor shaft is damaged, remove all the fragments and foreign matter left in the following passages in order to prevent a secondary failure:

- **Suction side:** Between turbocharger and intake manifold
- **Exhaust side:** Between turbocharger and catalyst

**NOTE:**
Figures which follow are intended to explain inspection procedures. (Shapes of parts may differ from those of actual parts.)
Inspection (Cont’d)

**Rotor shaft**
- Check that the rotor shaft rotates smoothly without any resistance when it is rotated by your fingertips.
- Check that the rotor shaft is not loose when it is moved vertically or horizontally.

**Rotor shaft end play**
Place a dial gauge at the rotor shaft end in the axial direction to measure the end play.

*Standard: 0.002 - 0.006 mm (0.0001 - 0.0002 in)*

**Turbine wheel**
- Check that there is no oil adhesion.
- Check that there is no carbon accumulation.
- Check that blades of the turbine wheel are not bent or broken.
- Check that the turbine wheel does not interfere with the turbine housing.

**Compressor wheel**
- Check that there is no oil adhesion inside the air inlet.
- Check that the compressor wheel does not interfere with the compressor housing.
- Check that the wheel is not bent or broken.

**WASTEGATE VALVE**
Remove rod pin and check wastegate valve for cracks, deformation and smooth movement.
Check valve seat surface for smoothness.
Apply air pressure to wastegate valve actuator and check it for smooth movement.

- Do not keep applying air pressure to the actuator.
- The air pressure should be in the range of 142.3 to 147.7 kPa (1.42 to 1.48 bar, 1.451 to 1.507 kg/cm², 20.7 to 21.4 psi).

Standard value for actuator rod operating pressure [when stroke is 1.5 mm (0.059 in)]:
142.3 - 147.7 kPa (1.42 - 1.48 bar, 1.451 - 1.507 kg/cm², 20.7 - 21.4 psi)
Trouble diagnosis of turbocharger

Preliminary check:
- Check that the engine oil level is between MIN and MAX of the dipstick. (When the engine oil amount is more than MAX, the oil flows into the inlet duct through the blow-by gas passage, and the turbocharger is misjudged failure.)
- Ask the customer if he/she always runs the vehicle in idle engine speed to cool the oil down after driving.
- Replace the turbocharger assembly when any malfunction is found after unit inspections specified in the table below.
- If no malfunction is found after the unit inspections, judge that the turbocharger body has no failure. Check the other parts again.

CAUTION:
As the internal mechanism of the idler gear must first of all, and always, be set by a bolt when removing the timing chain before removing the fuel injection pump and timing gear, follow the procedures in EC section, “Electronic controlled fuel injection pump”, “BASIC SERVICE PROCEDURE”.

- This chapter will deal with the summary of removing the timing chain before removing the camshaft and cylinder head.

Removal
1. Remove the following parts.
   - Air inlet pipe
   - Throttle body
   - Rocker cover
   - Spill tube
   - Coolant (Drain)
   - Radiator upper hose
   - Water outlet
   - Radiator shroud
   - Cooling fan
   - Drive belt
   - Vacuum pump
2. Move the following parts.
   - TDC sensor harness
   - Power steering oil pump
3. Remove the chain cover.
   - Remove the mounting bolts A to C shown in the figure.

**CAUTION:**
While the chain cover is removed, be careful not to allow entry of dust or foreign objects.

4. Set the No. 1 cylinder to the TDC.
   1) Turn the crankshaft pulley clockwise, and match the timing indicator of the gear case to the timing mark of the crankshaft pulley.

   2) Make sure that the cam sprocket match mark is in the position shown in the figure.
      - If the match mark is not in position, turn the crankshaft pulley once more and position it.
      - When removing at No. 1 cylinder TDC, each sprocket and chain is fitted using the match mark, therefore there is no need to apply any match marks beforehand.

   3. Loosen the cam sprocket holding bolt by fixing the hexagonal portion of the intake manifold side camshaft with a spanner, etc.
      - If the spill tube is not removed, fix the hexagonal portion of the exhaust manifold side camshaft.

**CAUTION:**
Be careful not to drop the plunger and spring.

5. Remove the chain tensioner.
   1) Loosen upper and lower holding bolts.
   2) Holding the chain tensioner in your hand, remove the upper holding bolt and release the spring tension.
   3) Remove the lower holding bolt, then remove the chain tensioner.
      - The chain tensioner does not have a mechanism which prevents the ejection of the plunger. (It does have a mechanism which prevents the plunger from returning.)

**CAUTION:**
Be careful not to drop the plunger and spring.

6. Remove the timing chain slack guide.
7. Remove the timing chain with cam sprocket.
   - Loosen the cam sprocket holding bolt by fixing the hexagonal portion of the intake manifold side camshaft with a spanner, etc.
   - If the spill tube is not removed, fix the hexagonal portion of the exhaust manifold side camshaft.

**CAUTION:**
Do not loosen the holding bolt by using the tension of the chain.
8. Remove the timing chain tension guide.
Installation

1. Install the timing chain tension guide.
2. Install the cam sprocket and the timing chain together.
   - Install by aligning the sprocket and timing chain match marks.
   - Tighten the cam sprocket holding bolt by fixing the hexagonal portion of the camshaft.

**CAUTION:**
Do not tighten in the holding bolt using the tension of the chain.

3. Install the timing chain slack guide.

**CAUTION:**
When the holding bolt is tightened to the specified torque, there is a gap between the guide and bolt. Do not over-tighten.

4. Install the chain tensioner.
   1) With the chain tensioner in the position shown in the figure (with the plunger on the outer side), temporarily tighten the holding bolt.
   2) Press the plunger into the tensioner body while pressing on the clips which prevent the plunger from returning.
   3) Install the upper side holding bolt while holding the plunger down with your finger and rotating it 180 degrees.
   4) Tighten the holding bolt to the specified torque.

5. Install the chain cover.
   1) Before installing chain cover, remove all traces of liquid gasket from mating surface using a scraper.
   2) Apply a continuous bead of liquid gasket to chain cover.
      - Use Genuine Liquid Gasket or equivalent.
      a. Coat of liquid gasket should be maintained within 2.0 to 3.0 mm (0.079 to 0.118 in) dia. range.
      b. Attach chain cover to gear case within 5 minutes after coating.
      c. Wait at least 30 minutes before refilling engine oil or starting engine.
   3) Install the chain cover.
      - The dimension below the neck of the holding bolt will vary depending on the part.

**Dimension below the neck:**
- A: 20 mm (0.79 in)
- B: 50 mm (1.97 in)
- C: 60 mm (2.36 in)
6. Install by following all removal procedures in reverse.

CAUTION:
- Arrange the TDC sensor harness in the position shown in the figure.
- Make sure that the harness has no deflection around the vicinity of the crankshaft pulley when installing the clamp.
Removal and Installation

For tightening torque, refer to the text.

- This engine will have a different valve arrangement from normal DOHC 4-valve type engines. As both camshafts on this engine have intake and exhaust cams, in this chapter they are named as follows:
  - Camshaft (Right side): Intake manifold side camshaft
  - Camshaft (Left side): Exhaust manifold side camshaft
- The same parts are used for the right and left sides.
- Refer to the figure for intake and exhaust valve arrangement. (The camshafts have, alternately, either an intake valve or an exhaust valve.)

Removal
1. Set the No. 1 cylinder at TDC, then remove the chain case, timing chain and other parts in connection. Refer to “TIMING CHAIN”. EM-107
2. Remove the cam gear.
   - Loosen the cam gear mounting bolt by fixing the hexagonal portion of the camshaft.
   - The idler gear cannot be removed at this point as the gear case is in the way. (The cylinder head can be removed as a single unit.)
3. Remove injection tube and injection nozzle assembly. Refer to EC section, “Injection Tube and Injection Nozzle” in “BASIC SERVICE PROCEDURE”.

4. Remove the camshaft.
   - Place distinguishing marks on the right and left sides with paint.
   - Loosen and remove the installation bolt in reverse order shown in the figure.

5. Remove the adjusting shim and valve lifter.
   - Remove by taking notice of the installation position, and place outside engine in order to prevent confusion.

**Inspection**

**VISUAL CHECK OF CAMSHAFT**
- Check the camshaft for one sided wear or scratches.
- Replace the camshaft if there are abnormalities.

**CAMSHAFT RUNOUT**
- Prepare V-block on a flat surface and secure camshaft journals No. 1 and No. 5.
- Set the dial gauge vertically on journal No. 3.
- Rotate camshaft in one direction by hand, then read needle movement on dial indicator. (Total indicator reading)
  - Limit: 0.02 mm (0.0008 in)

**HEIGHT OF CAM NOSE**

  - **Standard:**
    - Intake: 40.468 - 40.508 mm (1.5932 - 1.5948 in)
    - Exhaust: 40.830 - 40.870 mm (1.6075 - 1.6091 in)
  - Limit: 0.15 mm (0.0059 in)

  3. Rotate the crankshaft to face the cam for adjusting shims that are to be removed upward.
  4. Grip the camshaft with camshaft pliers (SST), using the camshaft as a support point, push the adjusting shim downward to compress the valve spring.

**CAUTION:**
Do not damage the camshaft, cylinder head, or the outer circumference of the valve lifter.

5. With the valve spring in a compressed state, remove the camshaft pliers (SST) by securely setting the outer circumference of the valve lifter with the end of the lifter stopper (SST).

- Hold the lifter stopper by hand until the shim is removed.

**CAUTION:**
Do not retrieve the camshaft pliers forcefully, as the camshaft will be damaged.

6. Move the rounded hole of the adjusting shim to the front with a very thin screwdriver.

- When the adjusting shim on the valve lifter will not rotate smoothly, restart from step 4 with the end of the lifter stopper (SST) touching the adjusting shim.

7. Remove the adjusting shim from the valve lifter by blowing air through the rounded hole of the shim with an air gun.

**CAUTION:**
To prevent any remaining oil from being blown around, thoroughly wipe the area clean and wear protective goggles.
8. Remove the adjusting shim by using a magnetic hand.

9. Measure the thickness of the adjusting shim using a micrometer.
   - Measure near the center of the shim (the part that touches the cam).
10. Select the new adjusting shim from the following methods.
   
   **Calculation method of the adjusting shim thickness:**
   
   \[ t = t_1 + (C_1 - C_2) \]
   
   - \( t \) = Adjusting shim thickness
   - \( t_1 \) = Thickness of the removed shim
   - \( C_1 \) = Measured valve clearance
   - \( C_2 \) = Specified valve clearance
   
   [when the engine is cool (at normal temperature)]

I Calculate gear clearance.
Clearance = d₁ − d₂

When repairing/replacing the following
1. When the top of cylinder block or crankshaft pin/journal is ground, or
2. When cylinder block, piston, connecting rod, or crankshaft is replaced
   1) Move piston toward TDC.
   2) Position dial indicator on cylinder block as shown in the figure, and adjust the needle to “0”.
   3) Move dial indicator stand aside, and position the dial indicator to the measuring point as shown in the figure.
   4) Rotate crankshaft slowly, and read the value on dial indicator at piston's maximum height.
   5) Repeat above procedure at 2 positions of each cylinder (8 positions in total for 4 cylinders), and select the appropriate gasket by comparing the maximum crown depression with the table.
2. Install idler gear and idler shaft.
   - Check that the counter marks with cam gear, “AA” and “BB”, are located on the front side of the engine.
   - Refer to [EM-133].

**CAUTION:**
Since idler gear cannot be installed or removed with cylinder head assembly mounted on the engine because of interference with gear case, make sure that there are no reverse installations or uninstalled parts.

- Standard: 0.035 - 0.077 mm (0.0014 - 0.0030 in)
- If out of specifications, check connecting rod big end inner diameter and crankshaft pin outer diameter, and select appropriate connecting rod bearing to adjust clearance to specifications.
- Refer to “Connecting rod bearing undersize list” on the next page.

Method using plastigage
- Remove contamination such as oil, dust completely from crankshaft pins and each bearing surface.
- Cut plastigage slightly shorter than bearing width, place it in crankshaft direction, avoiding oil holes.
- Install connecting rod bearings to caps, and tighten connecting rod nuts to the specified torque.
- CAUTION: Never rotate crankshaft.
- Remove connecting rod caps and bearings, and measure plastigage width using scale on plastigage bag.
- CAUTION: If out of specification, take same action mentioned in “Method by measurement”.

Undersize bearing usage
- If bearing clearance is out of specifications for connecting rod bearings in standard size, use undersize bearings.

- Pin: 3.3 - 3.7 mm (0.130 - 0.146 in)
- Journal: 2.8 - 3.2 mm (0.110 - 0.126 in)

MAIN BEARING CRUSH HEIGHT
- Tighten bearing caps to the specified torque with main bearings installed, and remove caps. The bearing end must then be higher than the flat surface.
  
  Standard: Crush height must exist.
- If out of specification, replace main bearings.
FLYWHEEL RUNOUT
- Attach flywheel to crankshaft. Use a dial gauge to measure
  runout of flywheel clutch-contact surface.
- Measure at position with diameter of 240 mm (9.45 in).
  Limit: 0.1 mm (0.004 in)
- If limit value is exceeded, replace flywheel.

Assembly
1. Blow air sufficiently to inside coolant passage, oil passage,
   crankcase, and cylinder bore to remove foreign matter.

2. Install main bearings and thrust bearings.
   1) Remove contamination, dust and oil from bearing mounting
      positions on cylinder block and main bearing caps.
   2) Install thrust bearings on both sides of No. 4 housing on cylin-
      der block.
      - Install thrust bearings with oil groove facing to crankshaft arm
        (outside).
   3) Being careful with the direction, install main bearings.
      - Install main bearings with the oil holes and grooves onto
        the cylinder block side, and those without oil holes and grooves
        onto the lower cylinder block side.
      - While installing bearings, apply engine oil to bearing surfaces
        (inside). Do not apply oil to rear surfaces, but clean them com-
        pletely.
      - Align stopper notches on bearings to install them.
      - Check that the oil holes on the cylinder block body are mated
        with the oil hole positions on the bearings.

3. Install crankshaft to cylinder block.
   - While rotating crankshaft by hand, check for smooth rotation.
   4. Install lower cylinder block.
   - Apply a continuous bead of liquid gasket to lower cylinder block
     as shown in the figure.
   - Using slots on engine sub-attachment, install the lower cylinder
     block to the cylinder block, avoiding interference of dowel pins.
5. Tighten lower cylinder mounting bolts to the torque shown below in 3 consecutive steps in the order shown in the figure.

- Sub-bolt No. 17 has shorter length than that of other sub-bolts.

6. Install mounting bolts for engine sub-attachment shown by arrows in the figure.
- After tightening bolts to the specified torque, check crankshaft for smooth rotation.
- Check crankshaft end play. Refer to EM-151, “CRANKSHAFT END PLAY”.

7. Install pistons to connecting rod.
   1) Using long nose pliers, install snap rings to grooves on piston rear side.
      - Fit snap rings correctly into grooves.
   2) Install pistons to connecting rods.
      - Using industrial dryer, heat pistons up to approx. 60 to 70°C (140 to 158°F) until piston pin can be pressed down by finger touch. Then insert piston pins into piston and connecting rod from front side of piston toward rear.

- Assemble piston and connecting rod with front mark of piston crown and cylinder No. stamped on connecting rod being positioned as shown in the figure.

   3) Install snap rings to front side of pistons.
      - Refer to above 1) for precaution on snap ring installation.
      - After installation, check connecting rods for smooth movement.

8. Use piston ring expander (multi-purpose tool) to install piston rings.

**CAUTION:**
When installing, prevent piston from being damaged.

- Install top ring and second ring with stamped surfaces facing upward.

  **Identification stamp:**
  Top ring: R
  Second ring: RN
9. Install connecting rod bearings to connecting rods and caps.
   - While installing connecting rod bearings, apply engine oil to bearing surfaces (inside). Do not apply oil to rear surfaces, but clean them completely.
   - Align stoppers on connecting rod bearings with connecting rod stopper notches to install connecting rod bearings.

10. Install piston and connecting rod assembly to crankshaft.
   - Move crankshaft pin to be removed to BDC.
   - Align cylinder position with cylinder No. on connecting rod to install piston and connecting rod assembly.
   - Using piston ring compressor (multi-purpose tool), install piston and connecting rod assembly with front mark on piston crown facing toward the front side of engine.
   **CAUTION:**
   When installing piston and connecting rod assembly, prevent the big end of connecting rod from interfering with oil jet.

11. Install connecting rod caps and mounting nuts.
   - Align cylinder No. stamped on connecting rod with that on cap to install connecting rod cap.
   - After tightening nuts, check crankshaft for smooth rotation.
   - Check connecting rod side clearance. Refer to [EM-151], “CONNECTING ROD SIDE CLEARANCE”.

12. Install rear oil seal and retainer assembly.
   - Apply a continuous bead of liquid gasket to rear oil seal and retainer assembly as shown in the figure.

13. Attach pilot bushing.
   - Use a drift with outer diameter 20 mm (0.79 in) (commercial service tool) to press-fit pilot bushing into crankshaft rear end hole.
- Apply liquid gasket to positions shown in the figure, then install rear plate.

15. Install removed parts to engine in the reverse order of disassembly.
16. Remove engine from engine stand.
17. Install flywheel.
- Using the same method as disassembly, secure crankshaft and tighten mounting bolts.
- Tighten mounting bolts for flywheel in order shown in the figure.
